Unsurprisingly, given Sigmund Freud's understanding of religion, the conversation between Christianity and psychoanalysis has long been marked by mutual suspicion. Psychoanalysis originated within a naturalist, post-Enlightenment context and sought to understand human functioning and pathology—focusing on phenomena such as the unconscious and object representation—on a strictly empirical basis. Given certain accounts of divine agency and human uniqueness, psychoanalytic work was often seen as competitive with a Christian understanding of the human person. The contributors to Christianity and Psychoanalysis seek to start a new conversation. Aided by the turn to relationality in theology, as well as by a noncompetitive conception of God's transcendence and agency, this book presents a fresh integration of Christian thought and psychoanalytic theory. The immanent processes identified by psychoanalysis need not compete with Christian theology but can instead be the very means by which God is involved in human existence. The Christian study of psychoanalysis can thus serve the flourishing of God's kingdom.

**The Art of Art Therapy**

Decades of research have demonstrated that the parent-child dyad and the environment of the familyâ€”which includes all primary caregiversâ€”are at the foundation of children's well-being and healthy development. From birth, children are learning and rely on parents and the other caregivers in their lives to protect and care for them. The impact of parents may never be greater than during the earliest years of life, when a child's brain is rapidly developing and when nearly all of her or his experiences are created and shaped by parents and the family environment. Parents help children build and refine their knowledge and skills, charting a trajectory for their health and well-being during childhood and beyond. The experience of parenting also impacts parents themselves. For instance, parenting can enrich and give focus to parents' lives; generate stress or calm; and create any number of emotions, including feelings of happiness, sadness, fulfillment, and anger. Parenting of young children today takes place in the context of significant ongoing developments. These include: a rapidly growing body of science on early childhood, increases in funding for programs and services for families, changing demographics of the U.S. population, and greater diversity of family structure. Additionally, parenting is increasingly being shaped by technology and increased access to information about parenting. Parenting Matters identifies parenting knowledge, attitudes, and practices associated with positive developmental outcomes in children ages 0-8; universal/preventive and targeted strategies used in a variety of settings that have been effective with parents of young children and that support the identified knowledge, attitudes, and practices; and barriers to and facilitators for parents' use of practices that lead to healthy child outcomes as well as their participation in effective programs and services. This report makes recommendations directed at an array of stakeholders, for promoting the wide-scale adoption of effective programs and services for parents and on areas that warrant further research to inform policy and practice. It is meant to serve as a roadmap for the future of parenting policy, research, and practice in the United States.

Abnormal behaviour patterns, from the jumping and somersaulting of caged laboratory mice to the pacing of enclosed ‘big cats’, are displayed by many millions of farm, zoo, research and companion animals. Including new chapters and over 30 contributors, this book focuses on the causation and treatment of these environment-induced stereotypic behaviours, and their implications for animal welfare and normalcy of brain functioning. The book begins by taking an ethological perspective, focusing on the constraints captivity places on animals’ normal behavioural repertoires, and the effects these have on specific motivational systems. It then addresses the role of dysfunction, particularly the impact of chronic stress and impoverished environments on brain functioning. The book then moves on to explore how stereotypic behaviours can be tackled, once they have emerged, using diverse techniques from environmental enrichment to pharmaceutical intervention. It concludes by giving a new definition for ‘stereotypic behaviour’, and a discussion of future research directions.
